1. What is the structure from motion problem?

1 / 1 point

- ☒ Estimating the 3D structure of a scene from a sequence of 2D images.
- ☐ Calculating the motion of objects in a scene without considering their 3D structure.
- ☐ Generating realistic motion in computer-generated animations.
- ☐ Tracking the position of a stationary camera in 3D coordinates over time.

✔ **Correct**

Estimating the 3D structure of a scene from a sequence of 2D images is the correct definition of the Structure from Motion (SfM) problem. It involves reconstructing the three-dimensional structure of the environment and the camera motion from a collection of two-dimensional images taken from different viewpoints.
