Quiz 4 - Joining & Filtering Data
Graded Assignment • 10 min

Due Nov 11, 11:59 PM IST

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 75%. We keep your highest score.

Next item →

1. Which method do we use for joining two tables? 1 / 1 point

- pd.join()
- pd.merge(left=df, right=df_cities, how='inner', left_on='city_id', right_on='id') ✓
- df.describe()
- df.head()

Nice work

Correct. The pandas function for performing joins is called *merge*. The arguments “left” and “right” specify the two DataFrames to be joined. The “left_on” and “right_on” arguments specify the join keys.

2. What does the following code do? 1 / 1 point

```
df[len(df) - 1 : ]
```

- Returns rows from 0 to the last one
- Returns the first row
- Returns the last two rows
- Returns the last row ✓

Nice work

Correct. The number len(df) – 1 indicates the index of the last row. We use the colon “:” to return a slice of DataFrame. Since we are slicing starting from the last row, only the last row is returned.

3. What is the result of the following code? 1 / 1 point

```
s = df["some_attribute"] == "some_value”
type(s)
```

- Series ✓
- DataFrame
- Boolean
- List

Nice work

Correct. “df["some_attribute"] == "some_value”” creates a Series with True/False values.

4. What does the following code do if “df” is a DataFrame that stores the movie information? 1 / 1 point

```
genre = df["genre"].isin(["Comedy", "Action"])
year = df["release_year"] == 2000
rating = df[“rating”]  > 4
df[genre & (year | rating)]
```

- Select the comedy movies and action movies that are released in 2000 or have ratings above 4. ✓
- Select the comedy movies and action movies that are released in 2000 and have ratings above 4.
- Select comedy movies and action movies that are not released in 2000 or have ratings equal to 4.

Nice work

Correct. “isin()” tests if genre is in the provided list. It returns True if it is in the list. “&” performs AND operation and “|” performs OR operation. It returns the rows where genre is True & (AND) (year is True | (OR) rating is True)

5. Which one is correct if we want to get the average rating for action movies? 1 / 1 point

- df[“rating”].mean()
- df[df[“genre”] == “Action”][“rating”].sum()
- df[df[“genre”] == “Action”][“rating”].mean() ✓

Nice work

Correct. “df[df[“genre”] == “Action”][“rating”]” returns the rating of action movies. The method mean() calculates the average value of these ratings.
