1 / 1 point

1. This figure shows 3 simulated random processes. How do they relate to each other?

- ☐ Same correlation length, different variance
- ☒ Same correlation length, same variance
- ☐ Different correlation length, same variance
- ☐ Different correlation length, different variance

✔ Correct

This is correct that the correlation length is the same, since all the fluctuations are at similar frequencies. Also, the variations in each sample seem to be about the same magnitude, so they are the same variance.

1 / 1 point

2. This figure shows 3 simulated random processes. How do they relate to each other?

- ☒ Same correlation length, different variance
- ☐ Same correlation length, same variance
- ☐ Different correlation length, same variance
- ☐ Different correlation length, different variance

✔ Correct

This is correct that the correlation length is the same, since all the fluctuations are at similar frequencies. Also, the variation in each sample clearly differs, so the variance is different.

1 / 1 point

3. This figure shows 3 simulated random processes. How do they relate to each other?

- ☐ Same correlation length, different variance
- ☐ Same correlation length, same variance
- ☒ Different correlation length, same variance

✔ Correct

Correct - The fluctuations are clearly at different frequencies from one sample to the next, so the correlation length is different. Also, the variations across the samples are about the same in each simulation, so the variance is the same.

- ☒ Different correlation length, different variance

✔ Correct

Correct - The fluctuations are clearly at different frequencies from one sample to the next, so the correlation length is different. Also, the variations across the samples are about the same in each simulation, so the variance is actually the same. This is hard to see, however, so I am allowing the answer of a different variance to be correct.
