Your latest: **100%** • Your highest: **100%** • To pass you need at least 60%. We keep your highest score.

1. Which of the following best reflects how agentic AI operates?

1 / 1 point

- ☐ An AI system generates an initial plan and follows it step by step to complete a task
- ☒ An AI system proposes actions, receives feedback from the environment, and adjusts its next steps accordingly
- ☐ An AI system selects the most likely response based on patterns learned from training data

✔ Nice work

Agentic AI is defined by its ability to make decisions, respond to feedback, and adapt its behavior as conditions change.

2. A user asks an AI system to recommend a restaurant. Instead of giving an immediate answer, the AI asks one question at a time (e.g., cuisine, location, preferences), updates its understanding based on each response, and then makes a recommendation. What is the primary advantage of this interaction approach?

1 / 1 point

- ☒ It allows the AI to gather context progressively and refine its decision based on user input
- ☐ It reduces the need for the AI to rely on its training data when generating responses
- ☐ It ensures the AI produces faster responses by minimizing the number of steps required

✔ Nice work

By asking questions step-by-step, the AI builds a better understanding of the user's needs and adapts its recommendation accordingly.

3. Which sequence best represents how an agent loop operates in an AI system?

1 / 1 point

- ☒ A task is given → the AI translates it into actions → the system executes them → the AI receives feedback and adjusts its plan → the cycle repeats
- ☐ A task is given → the AI generates a plan → a human executes the steps → the AI updates the plan only if explicitly prompted
- ☐ A task is given → the AI translates it into actions → the system executes them → the process completes without revisiting earlier steps

✔ Nice work

An agent loop works by continuously translating goals into actions, executing them, receiving feedback, and adapting until the task is complete.
