

Assessment Guide

After you submit your code, it will be automatically graded by a comprehensive suite of tests which will analyze your program for correctness and style. On some assignments, the autograder also analyzes running time and memory usage. The results are then compiled into a report, which you can view by clicking on the score which appears next to the submit button after the autograder completes.

The report consists of two major sections, the **Assessment Summary** and the **Assessment Details**. The Assessment Details section is further subdivided into **Compilation**, **API**, **SpotBugs**, **PMD**, **Checkstyle**, **Correctness**, **Memory**, and **Timing**.

Assessment Summary

The report begins with the Assessment Summary. An example is shown below.

```
1  Compilation: PASSED
2  API:         PASSED
3
4  SpotBugs:    PASSED
5  PMD:         FAILED (1 warning)
6  Checkstyle:  FAILED (0 errors, 3 warnings)
7
8  Correctness: 13/14 tests passed
9  Memory:      No tests available.
10 Timing:      No tests available.
11
12 Raw score: 94.29% [Compilation: 10%, API: 10%, Style: 0%, Correctness: 80%]
```

The Compilation, API, Spotbugs, PMD, and Checkstyle tests report either PASSED or FAILED, along with the number of warnings.

- The **Compilation** tests check whether your Java programs compile without warning or error. If the autograder cannot successfully compile your programs, you will not receive any credit or additional feedback for that program.
- The **API** tests verify that the APIs of your classes exactly match the APIs prescribed in the assignment specification.
- The **SpotBugs** and **PMD** tests inspect your program for common bug patterns. The results neither count toward your score.
- The **Checkstyle** tests check that your programs adhere to a set of style rules (see below for details). Warnings neither counts toward your score nor prevents additional analysis. If however
