Week 5 Outro and Assessment

# What Is Required to Train a Machine to Detect Fake Notes?

Do you think it is possible to train a machine to automatically detect fake notes? What would be required to do so?

Please share your thoughts and explain why do you think so?

Please comment on at least three posts by other learners.

Your response has been submitted. Engage and discuss with other learners.

Need large enough training images dataset, with individual images labeled as fake and not fake (balanced dataset is the best). Features can be extracted from the images and a binary classifier can be trained that can be used to predict whether or not an image is fake.

Yes it is possible to train a machine to automatically detect fake notes.

It would be required to collect data real bank notes and fake notes, then compare and analyze them.
