Coding Exercise 1

Problem

Create the function `find_usernames` that takes a list of email addresses and returns the username of each email address without the '@' symbol and without its domain name.

Expected Output

After creating the `find_usernames` function, pass it the following variable and print the return value.

```
emails = ['skateboard@bobaround.com', 'investigators@dangerous.com', 'vehicles@floatingvehicles.com']
```

Click the `TRY IT` button to run the file and check your work. The expected output is shown below.

TRY IT

[['skateboard'], ['investigators'], ['vehicles'], ['pipes'], ['engine'], ['water']]

[['skateboard'], ['investigators'], ['vehicles'], ['pipes'], ['engine'], ['water']]

Submit your work for evaluation.

Here is one possible solution:

```
import re

emails = ['skateboard@bobaround.com', 'investigators@dangerous.com', 'vehicles@floatingvehicles.com']

def find_usernames(emails):
    usernames = [re.findall('(\S+)@', email) for email in emails]
    return usernames

print(find_usernames(emails))
```

- Import the `re` module for regular expressions
- Create the function `find_usernames`
- Create a list comprehension that uses the regular expression `(\S+)@`
- This regular expression means to select all occurrences of any character that is not white space and which ends with `@`
- Return the list of usernames

Check It!

LAST RUN on 12/25/2023, 4:50:59 AM

[['skateboard'], ['investigators'], ['vehicles'], ['pipes'], ['engine'], ['water']]
