Formative Assessments

Formative Assessment 2

Complete the Parsons Puzzle.

The expected output:

Original Output for String Variable 'text': The only thing you wat

Output for String Variable 'text' Broken Up by Line:
The only thing you watch on TV is football.
The last 'book' you read was a football magazine.

Drag from here

for word in text_sent_tokens: print(word)

from nltk.tokenize import word_tokenize

text_sent_tokens = [sent_tokenize(text)]

Construct your solution here

from nltk.tokenize import sent_tokenize

text = "The only thing you watch on TV is football.
The last 'book' you read was a football magazine."

print("Original Output for String Variable 'text':
", text)

text_sent_tokens = sent_tokenize(text)

print("Output for String Variable 'text' Broken Up
by Line: ")

for sentence in text_sent_tokens: print(sentence)

The correct response is:

```
from nltk.tokenize import sent_tokenize
text = "The only thing you watch on TV is football. The last 'book' you
print("Original Output for String Variable 'text': ", text)
text_sent_tokens = sent_tokenize(text)
print("Output for String Variable 'text' Broken Up by Line: ")
for sentence in text_sent_tokens: print(sentence)
```

The following line of code would create a list, containing a sub list, which contains each sentence from `text`. If we used this, then we would need to account for it later when printing our output.

```
text_sent_tokens = [sent_tokenize(text)]
```

The following line of code imports the process which allows us to tokenize by word, not sentence as shown in the expected output above. This line is not necessary.

```
from nltk.tokenize import word_tokenize
```

Although running the following line of code along with the rest of correct code will produce the correct output, the language used is confusing. In this `for` loop, each element is called `word`, but each element should represent a sentence.

```
for word in text_sent_tokens: print(word)
```

Check It!

Mark as Completed
