Navigate to the Module 1 folder and open `DetectingEndoscopyAnomaliesFCDD.mlx`. Go through this reading to use an FCDD anomaly detector for endoscopy images, and refer to your results to answer the following questions.

✔ Correct

1. After importing and splitting the data and loading the detector, you set the anomaly threshold using the value calculated with the `anomalyThreshold` function. What is this threshold value?

1 / 1 point

0.104

✔ Correct

2. Once the anomaly threshold is set, you evaluate the model using a variety of different metrics. What is the global accuracy of the model on your test images?

1 / 1 point

0.88562

✔ Correct

3. The model seemed to have done pretty well in terms of accuracy, but depending on your application, you may care more about the precision or recall metrics. When you evaluated your model, what was your initial recall?

1 / 1 point

0.86351

✔ Correct

4. Imagine if a doctor used this model to decide if they needed to analyze the endoscopy results more closely. In this case, the model should have very high recall because the doctor should double check anything that could possibly be an anomaly. How would you adjust the threshold to increase recall?

1 / 1 point

In the last sections of the live script, visualize the distribution of anomaly scores to set a new threshold value. Then, evaluate the model again to see the new results.

☐ Increase the threshold

☒ Decrease the threshold

✔ Correct

Keep in mind that while we want high recall, we ideally do not want to sacrifice accuracy too much, so the doctor does not have to look through tons of normal images. Balancing needs for your application is common when you develop your own models.
