1. Which of the following statements about data augmentation is true?

1 / 1 point

☒ Data augmentation can improve model performance by adding more variation to the training images.

☐ Data augmentation generates new images according to your augmentation settings and saves each augmented image to your computer.

☐ Data augmentation always produces better results than collecting more data.

☒ Correct

Your models may generalize better to new data using augmentation.
2. How should you determine which types of transformations to include when performing data augmentation?

1 / 1 point

☐ Use all five types of augmentation because more variation is always better.

☒ Consider your dataset and application to decide which types of augmentation make sense.

☐ Try each of the different types of augmentation and choose the one that produces the best result.

☒ Correct

For different applications, you may need to use very different augmentation settings.
3. True or False: Augmentation is applied exactly once to each image in your training set.

1 / 1 point

☒ False

☐ True

☒ Correct

Augmentation is applied every epoch, producing multiple variations of the same image.
