

Example of Augmentation Improving Performance

In Course 2 of this specialization you evaluated a model to detect fasteners in images. The detector performed well on the Washer and Nut classes, but struggled more with the Nail and Screw classes. The dataset is small and the poor performance might be because the dataset lacked nails and screws at enough orientations for the model to make accurate predictions.

Navigate to the Course 3 -> Module 2 folder and open the file **EvaluatingAugFastenerDetectorResults.mlx**. Work through the Live Script to compare the results between the fastener detector from Course 2 and the fastener detector trained using augmentation.
