

Introduction to Parking Image Labeling Project

In this project, you will be working with images of three different types of available parking:

- "EV" for electric vehicle parking spots
- "Charger" for EV chargers
- "Accessible" for disabled parking locations

Attached is an object detector trained on a set of these images. This is the same detector as the one provided in the final project of Course 2. If you haven't already, download the following file and save it as "parkingYoloXDetectorSolution.mat".

parkingYoloXDetectorSolution

MAT File

Your goal is to use this detector to automatically label a new set of images, found under Data -> MathWorks Created -> Parking Spaces -> Additional Parking Images.

The main steps to this project are:

1. Create an automation function for the provided detector.
2. Follow the automated labeling workflow to label the new images in the Image Labeler app.
3. Adjust the labels and export the new results.

The following reading contains more detailed instructions. Good luck!
