

Evaluating Models in MATLAB

You just learned to use metrics like average precision (AP) and mean average precision (mAP) to evaluate object detection models. Navigate to the Coures 2 -> Module 3 folder and open the EvaluatingObjectDetectionModels.mlx file to see how to evaluate models using MATLAB.

In addition to calculating AP and mAP, you'll dive deeper into the object detector's confidence in predictions for specific classes.

Note: A detection ASL model was already trained and is provided in the Trained Models folder. The code used to train this model is also provided in the Course 2 -> Module 3 folder so that you have another example of training object detectors.
