Summary and Next Steps

# Overview of the Data

In this project, you will apply the concepts you learned earlier to a new dataset. Assume a company has collected a small dataset to identify different types of available parking. The data has three classes.

- EV for electric vehicle parking spots
- Charger for EV chargers
- Accessible for disabled parking locations

Your task is to train a model with this small dataset. Below are some example images from each class and their ground truth bounding boxes to help you better understand the data.

## EV Signs

EV signs come in different colors. Some signs have text below the EV symbol while others do not. Only the EV symbol is labeled in the data, not the entire sign. Below are two example images from the ground truth:

## Chargers

There are two different types of EV charges in the dataset, as shown below with their ground truth labels:

## Accessible

Accessible signs come in a few different varieties. Some are painted on the ground, some are larger signs that include text, and others are signs with no text. Only the wheelchair symbol is labeled in the ground truth. Three examples are shown with their ground truth labels:
