

Your Tasks for Part 3

Evaluate your model by doing an analysis similar to what you did previously in this course. Specifically, you need to:

1. Calculate the AP for each class and the mAP using an IoU threshold of 0.5
2. Calculate the mAP for a range of detection thresholds to determine an appropriate detection threshold to use with your detector
3. **Bonus** (not graded): Repeat the analysis above, but with an IoU of 0.75

We recommend using the provided EvaluatingObjectDetectionModels.mlx file provided located in the Module 3 folder as a starting point for your analysis.
