

Project: Introduction to the Traffic Signs Dataset

Throughout this course, you will see examples of preparing, training, and evaluating classification models, usually using a dataset of fasteners.

Each week of the course, you will then apply these skills to train, evaluate, and compare models to classify traffic signs.

The dataset includes nine different sign classes (shown below), denoting eight speed limits and an "end speed limit" sign.

Classifying traffic signs is essential for applications such as automated driving. These signs were chosen because they encompass nine classes and share many characteristics, making traditional machine learning methods ineffective for this application.

The dataset is already organized by class and divided into Train and Test folders.

To begin, open the `Week1Project.mlx` live script reading from Course 1 > Module 1 in the course files and follow the instructions.

Once you are satisfied with your trained model, take the following quiz, "Project: Classifying Traffic Signs with a Simple CNN." It will pose questions about your process and your final model. Throughout this course, you will have ample opportunities to improve upon this model with the skills you learn.
