Model Tuning & Evaluation +14 XP
92/1000 XP

1. If we have a situation where false positive is not as potentially costly as a false negative say flagging comments for manual review based on suspected unlawful activity, which of the following is the best approach to consider? 1 / 1 point

- Only look at the f-score of the negative class for evaluation
- Use recall as the evaluation metric
- Use precision as the evaluation metric
- Set beta to 0.5 in the fscore
- Set beta to 2.0 in the fscore

Nice work

Correct!

2. True/False. All classifiers in scikit-learn do multi-class classification out-of-the-box. These classifiers can differ in their approach though (e.g one-vs-all or one-vs-one). 1 / 1 point

- True
- False

Nice work

Correct!

3. Which of the following is **not** an example of a *generalized linear model* (GLM)? 1 / 1 point

- ANOVA
- Multinomial regression
- Poisson regression
- KNN regression
- Logistic regression

Nice work

Correct!

4. True/False. Models in the generalized linear mixture model (GLMM) family like multilevel models are generally optimized using sophisticated techniques like MCMC sampling. 1 / 1 point

- True
- False

Nice work

Correct!

5. When you use Watson Services like Watson Natural Language Understanding via the Python SDK, what are the three items that need to be saved? These items are generally saved on a local machine and included in scripts and notebooks as imported variables. 1 / 1 point

- service version, service API key, service JSON map
- service URL, service JSON map, service API key
- service API key, service version, service URL
- service version, service IAMAuthenticator, service URL
- service API key, service URL, service IAMAuthenticator

Nice work

Correct!

6. Which of the following does **not** describe a feature of the Watson Natural Language Understanding service? 1 / 1 point

- Perform document classification tasks using a custom model built from text
- Identify high-level concepts that aren't necessarily directly referenced in the text
- Find people, places, events, and other types of entities mentioned in your content
- Recognize when two entities are related, and identify the type of relation
- Analyze the sentiment toward specific target phrases and the sentiment of the document as a whole

Nice work

Correct!

7. Which of the following is **not** an example of a relevant question when tuning a NLP classification pipeline? 1 / 1 point

- Should I use bag-of-words or a vector embedding representation?
- Which stop words do I include?
- Which n-grams do I include?
- Should I use a TF or a tf-idf transformation?
- Should I use RMSE or MAE as an evaluation metric?

Nice work

Correct!
