1. Carlos has just started a new project in Microsoft Foundry and wants to test a text generation model in the Chat Playground. He needs to select a model, review the parameters, and run a test prompt. In which order should he complete these steps? — 1 / 1 point

- Review parameters, run a test prompt, then select a model deployment
- Open the Chat Playground, select a model deployment from the Model Catalog, review and adjust parameters, then run a test prompt
- Run a test prompt with the default model, then select a different model if the response is unsatisfactory
- Adjust parameters first, then select a model deployment, then run a test prompt

Nice work

Correct. Foundry's Chat Playground requires a model deployment before parameters or prompts can be tested. Selecting the model first ensures the parameter options match what that model supports.

2. A data analyst is starting a new project in Microsoft Foundry. What is an important first step to ensure organized progress? — 1 / 1 point

- Give the project a clear, descriptive name.
- Begin experimenting without first defining the project's purpose
- Invite collaborators before any setup is done
- Adjust default parameters before deciding on a model

Nice work

Correct! A clear name is the foundation for identification and management as the project grows.

3. Jin is exploring Microsoft Foundry for the first time. Which feature helps him quickly find and try out different AI models? — 1 / 1 point

- The Guardrails and Controls section
- The Model Catalog
- The Tracing panel
- The Data + Indexes section

Nice work

Correct! The Model Catalog lets users browse and select from available models before testing them in a Playground.

4. Luc ran three experiments in Microsoft Foundry, changing the learning rate in each run: 0.001, 0.01, and 0.1. The experiment with a learning rate of 0.01 produced the best accuracy. He now wants to confirm this is the optimal setting before finalizing. What is the most rigorous next step? Select the best answer. — 1 / 1 point

- Accept 0.01 as optimal since it outperformed the other two tested values.
- Deploy the model immediately since it achieved the best results in the current test.
- Switch to a different model type, as the current model may not be suited to this dataset.
- Run additional experiments with learning rates between 0.001 and 0.01 and between 0.01 and 0.1 to refine the search.

Nice work

Correct! Testing only three values identifies a promising range but does not confirm the global optimum. Running experiments at intermediate values (e.g., 0.005 and 0.05) narrows the search and provides stronger evidence that 0.01 is truly optimal before finalizing the configuration.

5. A user in Microsoft Foundry adjusts the temperature parameter during an experiment. What is this adjustment expected to affect? — 1 / 1 point

- The layout of the Foundry interface
- The order of models in the Model Catalog
- The diversity and creativity of the model's responses
- The compute resources assigned to the user

Nice work

Correct! Temperature controls how random or predictable the model's output is.

6. Sofia wants to review the safety and compliance settings applied to her AI application in Microsoft Foundry. Which section should she check? — 1 / 1 point

- The Model Catalog
- The Guardrails and Controls section
- The Data + Indexes section
- The Playgrounds section

Nice work

Correct! This section manages the safety and compliance settings applied to an AI application.

7. A team built an AI tool in Microsoft Foundry to summarize meeting notes. After deployment, they find it performs well on short meetings but produces poor summaries for meetings longer than two hours. They did not anticipate this limitation during development. What does this situation most likely indicate about their requirements definition process? Select the best answer. — 1 / 1 point

- The model selected was too basic; they should replace it with a more advanced model to handle longer inputs.
- This is a normal limitation of all AI summarization tools and cannot be addressed through better requirements definition.
- The team should have purchased more compute resources during development to handle longer meetings.
- The requirements definition did not account for the full range of input lengths the tool would encounter in practice.

Nice work

Correct! A performance gap on longer inputs indicates that the requirements definition did not fully specify the expected input range. Good requirements definition includes documenting the minimum, typical, and maximum input characteristics the tool will encounter — which would have flagged the need to test and account for long-form meetings.

8. Erin wants to understand why her experiment's accuracy decreased after changing a parameter. What should she focus on first? — 1 / 1 point

- Asking colleagues for subjective opinions only
- Updating user access permissions
- Increasing the compute resources for future runs
- Reviewing the changed parameter and its expected effect

Nice work

Correct! Understanding what that specific parameter controls is the direct way to explain a change in results.

9. After completing a round of model experiments, Nikhil wants to encourage team learning. Which action best supports this goal? — 1 / 1 point

- Summarize outcomes and share documentation with the team
- Keep experiment notes on his personal device
- Wait until the end of the project to share any conclusions
- Share only the list of models used, without further detail

Nice work

Correct! A clear summary lets the whole team learn from what was tried, not just the person who ran it.

10. A user wants to test the same prompt across multiple deployed models within Microsoft Foundry. Which section makes this easier? — 1 / 1 point

- The Data + Indexes section
- The Playgrounds section
- The Governance section
- The Guardrails and Controls section

Nice work

Correct! The Playgrounds section lets a user switch between deployed models and test the same prompt across each one.
