Graded Quiz: Module 3 Evaluation
Graded Assignment • 30 min

Due Nov 9, 11:59 PM IST

Your grade: 90%

Your latest: **90%** • Your highest: **90%** • To pass you need at least 80%. We keep your highest score.

Next item

1. A team plans to create a text generation application for writing product descriptions. Which first step lays the best foundation for their framework? Select the best answer. 1 / 1 point

- Creating a marketing plan for launch before finalizing application features.
- Selecting a pre-trained language model before deciding use cases.
- Defining application goals and listing main features.
- Designing a user interface based on popular apps in other industries.

Nice work

Correct! A clear understanding of goals and features helps guide the entire design and development process.

2. Which Microsoft Foundry component is most important for powering the text generation logic in a new application? 1 / 1 point

- Chat Playground
- A deployed model from the Model Catalog
- Python SDK
- Azure Blob Storage

Nice work

Correct! The application calls a model you've deployed through the Model Catalog to generate its text output.

3. A team has developed the initial version of a Microsoft Foundry-powered text generator for customer service emails. Before opening the application to user feedback, they want to verify that outputs are accurate, appropriate, and ready for real-world use. Which of the following approaches would effectively help validate the application's output quality at this stage? 1 / 1 point

- [x] Entering a diverse set of realistic customer queries to check whether the generated replies are accurate and appropriate

Nice work

Correct! Testing with realistic inputs is one of the most direct ways to evaluate whether the application is ready for real users.

- [x] Comparing a sample of generated replies against high-quality, approved customer service emails written by the support team

Nice work

Correct! Benchmarking generated outputs against known, approved examples gives the team a concrete quality standard to measure against.

- [ ] Confirming that the application's output length is consistent across all generated responses
- [ ] Checking the text generator's response time by running large batches of queries through the system

4. A product description tool in Microsoft Foundry returns generic outputs for new items. The development team wants more unique descriptions. Which action reflects proper use of prompt engineering? 0 / 1 point

- Adjusting model settings such as temperature to encourage more creative outputs.
- Updating the tool so users can select target keywords for the generated descriptions.
- Providing sample outputs to the model for guidance before generating new descriptions.
- Adding more product attributes and target market details directly to the input prompt.

Try again

Incorrect. This describes few-shot prompting, which helps with style — but the question asks about adding product-specific detail, which comes from attributes and context.

5. A user notes that responses from their Microsoft Foundry text generation app sometimes contain errors or off-topic content. Which approaches help improve quality? 1 / 1 point

- [x] Review and adjust prompt parameters.

Nice work

Correct! Tuning these can control output style and relevance.

- [ ] Increase the length of the prompt with unrelated background information.
- [x] Refine prompt wording for more clarity.

Nice work

Correct! Clear, detailed prompts help models provide accurate results.

- [ ] Focus on fixing issues after two updates.

6. A developer is fine-tuning their model by adding specialized training data relevant to their application's domain. They want to be clear about what fine-tuning can and cannot achieve before presenting results to their team. Which of the following are realistic goals that fine-tuning can help accomplish? 1 / 1 point

- [x] Teaching the model to use domain-specific terminology and phrasing more reliably

Nice work

Correct! When a model is fine-tuned on examples rich in domain-specific language, it learns to use that terminology naturally and accurately in its outputs.

- [x] Making the model's outputs more consistently aligned with the application's specific subject area

Nice work

Correct! By training the model on examples from a specific domain, the developer helps it learn the subject matter, vocabulary, and context that matter most for the application.

- [ ] Reducing the amount of computational resources required to generate each response
- [ ] Eliminating the need for any prompt engineering once the model is deployed

7. A text generator is being considered for sending customer support emails. What method best helps determine if the app serves its intended purpose? 1 / 1 point

- Measuring whether emails are sent within standard response time targets.
- Monitoring if generated emails are automatically logged into the customer database for recordkeeping.
- Testing whether email outputs fully answer customer questions and maintain a respectful tone.
- Checking if the generated emails use keywords found in frequently asked customer queries.

Nice work

Correct! Assessment focuses on clarity, correctness, and tone appropriate for customer support.

8. Which elements are fundamental to designing a basic text generation application framework? 1 / 1 point

- [x] Deciding input and output formats.

Nice work

Correct! This ensures all data flows smoothly in the app.

- [ ] Writing advanced deployment scripts first.
- [ ] Prioritizing visual branding before application logic is complete.
- [x] Outlining main application features and workflow.

Nice work

Correct! Clear planning supports easier development and maintenance.

9. A team aims to gain improved control over the results generated by their text application. Which activities will help them achieve this goal? Select all that apply. 1 / 1 point

- [ ] Limit feedback collection to internal team members.
- [x] Change prompt language based on real examples.

Nice work

Correct! Tailoring language based on real performance can increase the relevance and clarity of outputs.

- [x] Validate output through regular testing as features change.

Nice work

Correct! Ongoing validation ensures that application updates maintain output quality.

- [ ] Keep application prompt formats unchanged throughout updates.

10. A project team deploys a Microsoft Foundry-based text generator and reviews its first round of results. What is the most reliable way to determine if the application needs further enhancement? 1 / 1 point

- Recording the average server response time for each output provided during testing.
- Calculating the total number of text generations completed during the first test cycle.
- Gathering opinions from team members after the initial review is complete.
- Comparing the application's generated text with the project's clarity and style guidelines.

Nice work

Correct! Reviewing generated content against required standards directly shows if enhancement is needed.
