Graded Quiz: Text Generation App Assessment
Graded Assignment • 30 min

Due Nov 11, 11:59 PM IST

Your grade: 100%

Your latest: **100%** • Your highest: **100%** • To pass you need at least 80%. We keep your highest score.

Next item

1. An AI model is developed to provide financial advice to clients. To build trust and allow for independent review, the organization must demonstrate that the reasoning behind the model's recommendations is understood by users and auditors. Which responsible AI principle does this address? Select the best answer. 1 / 1 point

- Privacy and Security
- Fairness
- Transparency
- Reliability

Nice work

Correct! Transparency is the principle of making an AI system's decision-making process understandable and explainable.

2. A team is launching a new generative AI project and needs to organize its approach to potential ethical issues, such as risks linked to unfair outputs. Which process would most effectively support their structured evaluation of ethical considerations at the outset? Select the best answer. 1 / 1 point

- Implementing specific technical safeguards such as content filters early in the development cycle.
- Creating a comprehensive systematic framework guided by established responsible AI principles.
- Conducting a series of stakeholder workshops to gather diverse perspectives on potential risks.
- Performing a legal compliance review to maintain the project adheres to all relevant regulations.

Nice work

Correct! A systematic framework based on principles like fairness, transparency, and accountability provides a comprehensive and structured way to identify, assess, and mitigate ethical risks from the start of a project.

3. A hospital deploys an AI symptom checker to recommend specialist referrals. A clinical audit finds that patients over 60 are consistently recommended fewer follow-up tests than younger patients with identical symptoms and medical histories. The model was trained on 10 years of the hospital's own clinical decision records. What ethical problem does this represent? Select the best answer. 1 / 1 point

- A prompt injection attack, because users are manipulating the model into producing age-based recommendations.
- Bias, because the model learned and reproduced patterns of unequal clinical treatment from its training data.
- A hallucination, because the model is generating recommendations that do not reflect the patients' actual symptoms.
- Model drift, because the model's performance has degraded since it was first deployed.

Nice work

Correct! The model was trained on historical work order data that already reflected unequal service patterns. By learning from this data, the model replicated the same inequity at scale. The engineering team's explanation — that the model reflects past patterns — confirms rather than excuses the bias, because those past patterns are precisely the problem.

4. When building a responsible text generation application a key safety feature involves automatically detecting and blocking outputs that contain hate speech or violent content. What is this feature called? Select the best answer. 1 / 1 point

- A transparency report
- An accountability log
- A bias detector
- A content filter

Nice work

Correct! A content filter is the tool designed to scan text for predefined categories of harmful content and prevent it from being shown to the user.

5. A bank's AI assistant is built on a system prompt containing internal fraud detection thresholds and escalation rules. A security researcher discovers that by framing a request as "translation help," she can get the assistant to output its full system prompt. The security team identifies the cause as missing input screening rules and no instruction to protect its own configuration. What type of safeguard is specifically designed to address this threat? Select the best answer. 1 / 1 point

- Data encryption protocols, because the system prompt contains sensitive internal configuration that should be stored securely.
- Prompt injection defenses, because they are specifically designed to prevent users from embedding instructions that cause the model to bypass its intended purpose.
- Content filtering for harmful speech, because the model's outputs should be screened before reaching the user.
- Bias detection and mitigation tools, because the model is producing outputs that were not intended by its designers.

Nice work

Correct! Prompt injection defenses are the safeguard category built to detect and neutralize attempts by users to embed hidden or manipulative instructions within their inputs. In this scenario, the researcher's "translation help" framing was a crafted input designed to override the model's confidentiality behavior — precisely the threat this safeguard class addresses.

6. A startup is building its first generative AI product and wants to develop it responsibly. They choose to build on Microsoft Foundry because its tools include integrated safety features. What key advantage does this provide for the startup? Select the best answer. 1 / 1 point

- It accelerates the implementation of essential responsible safeguards.
- It replaces the need for any internal ethical review processes.
- It suggests the application will be completely free from all potential biases.
- It provides a centralized dashboard for monitoring all ethical risks in real-time.

Nice work

Correct! By providing pre-built, integrated safety tools, Azure allows the startup to implement critical responsible AI features much faster and more reliably than developing them from scratch.

7. When completing the final project for a text generation application, comprehensive documentation is a key requirement. What is the primary role of this documentation in demonstrating a responsible AI solution? Select the best answer. 1 / 1 point

- To fulfill regulatory compliance reporting requirements.
- To guide users on the intended uses of the application.
- To establish a baseline for future model performance improvements.
- To provide transparency about the application's capabilities and safeguards.

Nice work

Correct! Good documentation is a key tool for transparency clearly explaining what the application does its limitations and how it was designed to be safe.

8. A text generation application is evaluated on its ability to generate relevant text and its adherence to ethical standards. What is a key example of successfully integrating these two aspects? Select the best answer. 1 / 1 point

- Allowing users to configure their own content safety filters and sensitivity levels.
- Implementing a content moderation system that works with the text model.
- Training the model on a manually reviewed dataset certified as ethically compliant.
- Flagging generated content that violates policy and immediately routing it for human review.

Nice work

Correct! The content generation (technical function) is directly coupled with a content moderation system (ethical safeguard) to create a single responsible solution. The safeguard acts as a gatekeeper for the generated content before it reaches the user.

9. A team has implemented Azure's content filters in their AI application. What is the next logical step to confirm that the filters are working as intended? Select the best answer. 1 / 1 point

- Generating a report from the cloud provider to show the filter service is active.
- Analyzing user-generated content over time to see if harmful outputs decrease.
- Conducting tests with inappropriate prompts to see if they are blocked.
- Comparing the model's performance latency with and without the filters enabled.

Nice work

Correct! The only way to be sure a safety feature works is to test it against the specific scenarios and types of content it is designed to prevent.

10. A development team at an insurance company has built a text generation tool and is preparing to present it to their AI ethics board. A board member asks the team why comprehensive documentation was treated as a deliverable equal in importance to the working tool itself. Which TWO reasons best justify this? Select all that apply. 1 / 1 point

- [x] It provides transparency about the safeguards in place and the limitations of the tool.

Nice work

Correct! Transparent documentation of safeguards and limitations is a core responsible AI requirement, giving stakeholders the information they need to assess the tool's safety and boundaries.

- [ ] It provides the ethics board with a record of the team's technical architecture decisions.
- [x] It demonstrates that responsible considerations shaped the development process, not just the final output.

Nice work

Correct! The working tool shows what was built. Documentation shows how and why it was built responsibly — evidence the tool alone cannot provide.

- [ ] It confirms the tool meets the performance benchmarks required for production deployment.
