COACH

Almost there! Let's review your answers and then try again.

Your work demonstrated a strong understanding of AI concepts, particularly in areas such as machine learning models, AI alignment with human values, and the Turing test. However, there is room for improvement in understanding the nuances of AI benchmarks and their acceptance. Before retrying this assignment, we recommend focusing on these key areas:

- **AI Progress Based on Contributions from Mainframe or Still Evolving, and Emergent Technologies:** In Question 6, your understanding of ChatGPT's performance on the Turing test was incorrect. Try reviewing [this link](#) to refresh your memory on the current state of AI benchmarks and their acceptance.

Good job on the rest of the assignment!

Retry assignment

Instructions

1. According to the article [Strong AI versus Weak AI: What is the Difference?](#), what is a defining feature of Strong AI (Artificial General Intelligence - AGI) compared to Weak AI?

1 / 3 point

☐ Strong AI can perform specific tasks very efficiently.

☒ Strong AI is fully capable of learning, thinking, and adapting like a human.

☐ Strong AI can play chess better than any human.

☐ Strong AI can respond to immediate tasks without learning from past experiences.

☒ Correct

The article describes Strong AI (or AGI) as having the capability to behave and perform actions similarly to human beings, including solving problems and learning new skills in ways similar to humans. It emphasizes that Strong AI can learn, think, and adapt just like humans, which is the main characteristic that sets it apart from Weak AI.
2. Based on the article [System 1 and System 2 Thinking](#), what is one benefit of System 2 thinking?

1 / 3 point

☐ System 2 thinking allows for quick and effortless decision-making in urgent situations.

☐ System 2 thinking enables us to follow instructions and complete tasks without needing to think critically about each step.

☒ System 2 thinking helps us to analyze information carefully, consider different options, and make well-reasoned choices.

☐ System 2 thinking allows us to operate on autopilot and navigate routine situations without needing conscious awareness.

☒ Correct
3. According to the article [Aligning AI to Human Values Means Picking the Right Metrics](#), what is a key challenge in aligning AI systems with human values?

1 / 3 point

☐ AI systems themselves are inherently resistant to incorporating human values because they operate on different principles.

☐ There is a universal agreement on what human values are, making it straightforward to implement them into AI systems.

☐ We lack the technological capability to create AI systems that can understand and act according to human values.

☒ The vast amount of data required to train AI systems makes it difficult to ensure that the values reflected in that data are truly human values.

☒ Correct
4. According to the article [What is the Turing Test?](#), what is the main purpose of the Turing test?

1 / 3 point

☐ To definitively determine if a machine can achieve human-level intelligence.

☐ To measure a machine's ability to perform complex mathematical calculations and solve logic problems.

☐ To provide a practical tool for training and improving the capabilities of chatbots and virtual assistants.

☒ To evaluate a machine's ability to exhibit intelligent behavior equivalent to, or indistinguishable from, that of a human.

☒ Correct
5. Based on the article [Aligning AI to Human Values Means Picking the Right Metrics](#), what key concept underlies the alignment of AI with human values in the article?

1 / 3 point

☐ The use of AI to entirely replace human decision-making in social media platforms.

☒ The necessity of involving community feedback in the selection of metrics for AI optimization.

☐ AI systems should be designed without the use of metrics to avoid manipulation.

☐ Profit maximization should be the primary metric for all AI systems.

☒ Correct

The reading emphasizes the importance of involving the people affected by AI systems in the selection of metrics that govern these systems. This is discussed in the context of "picking metrics" and the participatory design, where he argues for the need for community involvement in creating software and metrics ("collaboratively picking a metric is a unique challenge"). It also highlights how current practice involves metrics that attempt to capture human outcomes and that community feedback can refine these efforts, as demonstrated by Facebook's use of well-being metrics based on user feedback.
6. According to the article [ChatGPT passed the Turing Test](#), did ChatGPT definitively pass the Turing test in a generally accepted way?

1 / 3 point

☒ Yes, ChatGPT's performance on the Turing test is considered a definitive benchmark for machine intelligence.

☐ No, the passage mentions limitations of the Turing test itself, and passing it does not guarantee true intelligence.

☐ The passage doesn't mention the Turing test at all.

☐ There is no mention of ChatGPT in this reading.

☒ Incorrect

The passage suggests there might be debate or ambiguity surrounding this claim.
7. According to the article [How To Implement AI for Businesses](#), what is a primary benefit of implementing AI in business operations by the 'Upwork Team'?

1 / 3 point

☐ AI can eliminate the need for human employees in businesses.

☒ AI significantly enhances personalization and customer experiences by learning individual preferences.

☐ AI replaces the need for managerial decision-making in businesses.

☐ AI tools eliminate the risk of data breaches in organizations.

☒ Correct

The article states that "Artificial intelligence tools are powered by machine learning algorithms that can learn and understand individual preferences, behaviors, and demographics and tailor content and recommendations to each specific consumer needs," highlighting the enhancement of personalization and customer experiences.
8. According to the reading [How to Deploy Conversational AI](#), what is a key consideration for deploying a conversational AI?

1 / 3 point

☐ Choosing a highly skilled team of developers.

☐ Ensuring compatibility with existing customer support platforms.

☐ Using the most advanced AI technologies regardless of cost.

☒ Aligning company functions like customer care, compliance, and tech teams.

☒ Correct

The text specifically mentions the necessity of aligning various company functions such as customer care, compliance, and tech teams. This alignment is essential for managing and moving forward different stages of integrating, deploying, and expanding the conversational AI system.
9. Based on the article [Machine Learning versus Traditional Statistical Models](#), when might a traditional statistical model be preferred over a machine learning model?

1 / 3 point

☐ When dealing with a very complex problem with numerous variables and intricate relationships.

☒ When a clear understanding of the underlying factors influencing the data is desired, in addition to making predictions.

☐ When the amount of data available for training a machine learning model is extremely limited.

☐ When the interpretability and reasoning behind the model's predictions are not crucial for the task at hand.

☒ Correct
10. According to the reading [Machine Learning Model Deployment](#), what is ML deployment?

1 / 3 point

☒ Deployment is the method by which you integrate a machine learning model into an existing production environment to make practical business decisions based on data.

☐ Gathering a large new dataset to retrain the model.

☐ Completely redesigning the model architecture to improve accuracy.

☐ Reducing the model's complexity.

☒ Correct
11. The article [Aligning AI to Human Values Means Picking the Right Metrics](#) mentions the concept of "metrics" in the context of AI and human values. What is the role of metrics according to the passage?

1 / 3 point

☐ Metrics provide a way to directly measure an AI system's understanding of human values, like its ability to express empathy.

☒ By defining and measuring specific desired outcomes, metrics can help evaluate how well an AI system aligns with human values in practice.

☐ Metrics are a way to standardize the development process for all AI systems, ensuring they are built with the same set of human values in mind.

☐ Metrics can simplify the complexity of human values into easily understandable categories that can be directly programmed into AI systems.

☒ Correct
12. According to the PowerPoint slides for Module 2, what is a key difference between traditional statistics and machine learning (ML)?

1 / 3 point

☐ Traditional statistics focuses on operational effectiveness, while ML emphasizes being correct on average.

☒ Traditional statistics requires a hypothesis or theory to specify a model with a limited set of variables, while ML flexibly accommodates very complex models with a large number of variables.

☐ ML systems can explain the "why" behind their predictions, while traditional statistics cannot.

☐ ML does not require predictions; instead, it focuses on learning and improving over time.

☒ Correct
13. According to the article [Machine Learning versus Traditional Statistical Models](#), what is a key difference between machine learning and traditional statistical models in terms of their approach to data analysis?

1 / 3 point

☐ Machine learning models require smaller datasets to train effectively.

☐ Machine learning models are less adaptable to new data compared to traditional statistical models.

☒ Machine learning models can automatically discover important features from the data.

☐ Traditional statistical models are better suited for high-dimensional data analysis.

☒ Correct

The article explicitly mentions that some machine learning algorithms "can automatically discover important features from the data, eliminating the need for manual feature engineering." This capability allows machine learning models to identify crucial patterns in new data without explicit programming, which is not typically a feature of traditional statistical models.
14. Based on the reading [What's the difference between supervised, unsupervised, semi-supervised, and reinforcement learning?](#), what is one potential benefit of using semi-supervised learning?

1 / 3 point

☒ Semi-supervised learning is especially advantageous when identifying relevant features from the data is difficult.

☐ Semi-supervised learning algorithms are inherently simpler and require less computational resources to train compared to other learning approaches.

☐ Semi-supervised learning is always the most accurate learning method and should be used for all tasks whenever possible.

☐ Semi-supervised learning is particularly useful for tasks that require human-like reasoning and problem-solving abilities.

☒ Correct
15. According to the article [ANN vs. LNN vs. RNN](#), what capability do RNNs have?

1 / 3 point

☐ RNNs can effectively identify and remove irrelevant information from sequential data, allowing them to focus on important patterns.

☒ RNNs have an in-depth understanding of sequences and their context in contrast with other neural networks and it can map out many to many, one to many, and many to one input and outputs.

☐ RNNs are computationally less expensive compared to other neural network architectures, making them suitable for real-time applications.

☐ RNNs are inherently more accurate than ANNs and CNNs for all tasks involving sequential data like text or time series analysis.

☒ Correct
