Module 8 Introduction
Lesson 1: Fine-tuning / multi-task learning
Lesson 2: Domain adversarial training
Lesson 3: Zero-shot learning
Module 8 Summative Assessment
Graded Assignment: Module 8 Summative Assessment Submitted
Module 8 Summary

Your grade: 86.66%

Your latest: 86.66% • Your highest: 86.66% • To pass you need at least 80%. We keep your highest score.

1. How does domain-adversarial training benefit Transfer Learning? 1 / 1 point
   - By preventing the model from learning any useful features
   - By making the model's features less invariant to the source domain
   - By encouraging the model to learn features that are domain-invariant
   - By focusing on labeled data
   - Correct. Correct!
2. What is one-shot learning? 0 / 1 point
   - Learning from a large amount of data
   - Learning without any examples
   - Learning from a very few examples in the target domain
   - Learning with only labeled data
   - Incorrect. Incorrect, One-shot learning refers to learning from just one example.
3. In Domain-adversarial Training, what is the goal of the domain classifier? 1 / 1 point
   - To classify images as quickly as possible
   - To differentiate between source and target domain features
   - To increase the accuracy of label prediction
   - To ignore domain-specific features
   - Correct. Correct!
4. What is zero-shot learning? 1 / 1 point
   - Learning from data that has been seen during training
   - A method that requires extensive labeled data for new tasks
   - Learning to recognize new classes that were not seen during training
   - Using only source domain data for training
   - Correct. Correct!
5. In what situation early network layers may need to be fine-tuned? 1 / 1 point
   - Never.
   - Always.
   - If the input representation changes.
   - If the task changes.
   - Correct. Correct!
6. How does *Transfer* Learning leverage unlabeled data? 1 / 1 point
   - By ignoring it entirely
   - Through self-taught learning and clustering approaches
   - Using it only for testing purposes
   - Treating it as labeled data
   - Correct. Correct!
7. How is the problem of zero loss addressed in Zero-shot Learning? 1 / 1 point
   - By ensuring all embeddings are equidistant
   - By defining a margin that separates close and not-as-close embeddings
   - Ignoring the loss entirely
   - Through random assignment of attributes
   - Correct. Correct!
8. What is the significance of Convex Combination in Semantic Embedding for Zero-shot Learning? 1 / 1 point
   - It simplifies the model to linear relationships only
   - It allows the creation of new class representations by combining known ones
   - It eliminates the need for a neural network
   - It is a method for reducing computational cost
   - Correct. Correct!
9. Why is labeled source data important in Transfer Learning? 1 / 1 point
   - It is not important; only unlabeled data is used
   - It provides a basis for initial model training before fine-tuning
   - It is used to test the final model
   - It exclusively determines the model's architecture
   - Correct. Correct!
10. In image transfer learning, which layers are typically copied from the source model? 0 / 1 point
    - The last few layers
    - The first few layers
    - Only the middle layers
    - No layers are copied; they are all retrained
    - Incorrect. Incorrect. Last layers in a pre-trained image model might be specific to the source image category and less reusable.
11. What challenge does multitask learning aim to address? 1 / 1 point
    - Learning tasks in isolation without leveraging commonalities
    - Overfitting to a single task
    - Using only a single layer in neural networks
    - Ignoring labeled data
    - Correct. Correct!
12. What does multitask learning in neural networks utilize? 1 / 1 point
    - A single-layer structure
    - A multi-layer structure suitable for learning multiple tasks simultaneously
    - Only unsupervised learning techniques
    - Separate models for each task
    - Correct. Correct!
13. What does the adaptation of a model to new, limited target data aim to prevent? 1 / 1 point
    - The model learning anything new
    - Overfitting to the target data
    - The use of any source data
    - Changes to the model's architecture
    - Correct. Correct!
14. What does 'embedding space' in Zero-shot Learning represent? 1 / 1 point
    - A physical space where data is stored
    - A conceptual space where similar attributes are closer together
    - The total memory used by the neural network
    - A database of all possible attributes
    - Correct. Correct!
15. In Transfer Learning, what is 'Source Data'? 1 / 1 point
    - Data that is used for the final task
    - The initial data on which the model is pre-trained
    - Data without labels
    - Data that is not related to the task at all
    - Correct. Correct!
