1. Parameter Quantization in neural networks is primarily used for what purpose? 1 / 1 point

- To increase the precision of the network's weights.
- To enhance the quality of data used for training.
- To increase the number of parameters for better performance.
- To represent weights with lower precision to reduce model size.

Correct
Correct!

2. When discussing "Architecture Design" for network compression, what is typically a primary consideration? 1 / 1 point

- The ability of the network to self-adjust its architecture during training.
- The aesthetic appearance of the network's graphical representation.
- The theoretical maximum depth and width of neural networks.
- The physical design of the chips on which the network will run.

Correct
Correct!

3. What does the term "Dynamic Computation" refer to in the context of neural networks? 1 / 1 point

- The dynamic nature of backpropagation during training.
- A network's ability to perform varying amounts of computation depending on the input.
- Adjusting computational resources based on network load.

Correct
Correct!
