

Module 1 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Describe the difference between logistic regression and ordinary linear regression.
- Compute the odds of an event.
- Describe how to obtain the regression parameters using the maximum likelihood method.
- Using R, compute the estimators of a logistic regression model when presented with a data set.
- Using R, give a probabilistic prediction of $Y=1$ given $X=x$'s.
- Able to interpret and draw conclusions from the R output of the logistic model.
