

Module 2 Summary

After completing all of the materials, please take a moment to reflect on what was covered. The learning objectives below capture the key takeaways from this module:

- Describe the difference between Poisson regression and ordinary linear regression.
- Describe how to obtain the regression parameters using the maximum likelihood method.
- Using R, compute the estimators of a Poisson regression model when presented with a data set.
- Able to interpret and draw conclusions from the R output of the Poisson model.
- Upon completion of this module, you will be able to:
- Describe the similarity between the linear, logistic, and Poisson regression through link function.
- Using R, compute the estimators of a generalized linear model using the correct link function.
