Almost there! Let's review your answers and then try again.

Your work showed skill in understanding the benefits of using hooks in CNNs and deploying REST APIs with Google Cloud, but there is room for growth in understanding the scenarios for using hooks in CNNs and setting up model instances for REST endpoints. Before retrying this assignment, we recommend focusing on these key areas:

- **Hooks (101):** In Question 1, your understanding of scenarios that can benefit from using hooks in a CNN was not accurate. Try reviewing [this item](#) to refresh your memory on the applications of hooks in CNNs.
- **API On-Premise with Deep Learning Model (Coding):** In Question 5, your response missed some essential steps when setting up a model instance and creating a REST endpoint for predicting iris flowers. Try reviewing [this item](#) to better understand the complete process.

Good job on the rest of the questions!

Retry assignment

1. Which scenarios can benefit from using hooks in a CNN?

0.6 / 1 point

- ☐ Inspecting model performance on unseen data
- ☐ Automatically tuning hyperparameters
- ☐ Replacing the optimizer during training
- ☐ Diagnosing overfitting
- ☒ Visualizing feature maps at different layers

Correct Correct! Hooks can be used to visualize feature maps at different stages of the network.

You didn't select all the correct answers

2. Which of the following are benefits of using hooks in CNN for troubleshooting?

1 / 1 point

- ☐ Changing the learning rate dynamically
- ☒ Monitoring and analyzing layer outputs

Correct Correct! Hooks are excellent for monitoring and analyzing outputs at various network layers.

- ☐ Improving model accuracy automatically
- ☒ Identifying vanishing gradients

Correct Correct! Hooks can help identify issues like vanishing gradients by inspecting intermediate values.

3. What is the benefit of using Google Cloud Functions for deploying a REST API?

1 / 1 point

- ☐ Better relational database management
- ☐ Enhanced data visualization capabilities
- ☐ Improved machine learning model training
- ☒ Automatic scaling based on the number of requests

Correct Correct! Google Cloud Functions automatically scale based on the number of incoming requests.

4. What are the steps involved in deploying PyTorch model weights to Google Cloud Storage?

1 / 1 point

- ☐ Training the model within Google Cloud Storage
- ☒ Setting up a Google Cloud Storage bucket

Correct Correct! Setting up a Google Cloud Storage bucket is a necessary step.

- ☐ Configuring the Flask application
- ☒ Uploading the model weights to the storage bucket

Correct Correct! Uploading the model weights to the storage bucket is a critical step.

- ☒ Granting public access to the model weights

Correct Correct! Granting public access to the model weights is essential for others to use them.

5. Which of the following steps are essential when setting up a model instance and creating a REST endpoint for predicting iris flowers?

0.8 / 1 point

- ☒ Loading pre-trained model weights

Correct Correct! Loading pre-trained model weights is an essential step.

- ☐ Setting up the Flask application
- ☒ Creating endpoint routes for prediction

Correct Correct! Creating endpoint routes for prediction is necessary for the REST API.

- ☐ Creating a dataset from raw data
- ☐ Defining the model architecture from scratch
