1. What is a key advantage of using hooks for debugging CNNs?

1 / 1 point

- ☐ They reduce the computational cost of training
- ☐ They replace the need for a validation dataset
- ☒ They allow for real-time inspection without halting training
- ☐ They automatically correct errors in the network

 **Correct**
Correct! Hooks enable real-time inspection, which is valuable for debugging without stopping the training process.

2. What is a primary use of forward hooks in a Convolutional Neural Network (CNN)?

1 / 1 point

- ☐ To directly update weights of specific layers
- ☐ To modify gradient values during backpropagation
- ☒ To inspect intermediate activations after certain layers
- ☐ To completely halt the training process

 **Correct**
Correct! Forward hooks allow you to inspect intermediate activations and gain insights into the internal workings of the network.

3. What are the steps involved in deploying PyTorch model weights to Google Cloud Storage?

1 / 1 point

☒ Setting up a Google Cloud Storage bucket

 **Correct**
Correct! Setting up a Google Cloud Storage bucket is a necessary step.

☒ Uploading the model weights to the storage bucket

 **Correct**
Correct! Uploading the model weights to the storage bucket is a critical step.

☐ Configuring the Flask application

☒ Granting public access to the model weights

 **Correct**
Correct! Granting public access to the model weights is essential for others to use them.

☐ Training the model within Google Cloud Storage

4. Which tool can be used to test and monitor a deployed cloud function for user input predictions?

1 / 1 point

- ☐ Jupyter Notebook
- ☐ SQLite
- ☒ Postman
- ☐ TensorBoard

 **Correct**
Correct! Postman is commonly used to test and monitor APIs.

5. What is the primary purpose of using Flask in developing a REST API?

1 / 1 point

- ☐ To perform data visualization
- ☐ To train machine learning models
- ☒ To handle HTTP requests and define endpoints for the API
- ☐ To store data in a relational database

 **Correct**
Correct! Flask is used to handle HTTP requests and define endpoints for the API.
