

degree centrality

`degree centrality(G)`

Compute the degree centrality for nodes.

The degree centrality for a node v is the fraction of nodes it is connected to.

Parameters: **G** : graph

A networkx graph

Returns: **nodes** : dictionary

Dictionary of nodes with degree centrality as the value.

[betweenness centrality](#), [load centrality](#), [eigenvector centrality](#)

Notes

The degree centrality values are normalized by dividing by the maximum possible degree in a simple graph $n-1$ where n is the number of nodes in G .

For multigraphs or graphs with self loops the maximum degree might be higher than $n-1$ and values of degree centrality greater than 1 are possible.
