Graded Exercise - Converting a Python Model to JavaScript

Week 3 Wrap up

This was a difficult but exciting week that helps tie everything together. In addition to being able to train models in JavaScript, you saw how to use other people's models as well as the process of converting Machine Learned models from their binary format when created with TensorFlow to JSON which can then be loaded with TensorFlow.js and used for inference. You've come a long way since week 1. Next week we'll wrap the course by looking at one other important skill in Machine Learning -- and that's transfer learning, which you'll do by creating a complete site from scratch!
