Wrap up

Congratulations! You've just come through a lot of concepts, starting from incorporating TensorFlow into your browser, through training your first model, all the way up to using transfer learning from an existing image classifier to capture and classify from the web cam. Along the way you saw how to use existing models, train your own, or convert your Python based ones to make them usable in TensorFlow. We hope this has been a great primer to help you bring your ML skills to JavaScript and your JavaScript skills to ML!
