Rules, Trees, and Neural Networks Programming Exercise

This programming exercise is ungraded, providing you with a low-pressure environment to explore and learn. However, we highly encourage you to use this rubric to evaluate your own work. Self-assessment is a powerful tool for improving your skills and understanding. If you encounter any difficulties or have questions while working on your labs, don't hesitate to reach out to your peers in the discussion forum. Engage actively, support each other, and make the most of this learning experience!

Instructions

`imodels` is an interpretability library in python that has support for many decision rule set and list algorithms.

Access: <https://github.com/csinva/imodels?tab=readme-ov-file>

From the list of supported models available in the README (link above), choose three algorithms to demo on a dataset of your choice.

In addition to a demonstration for each of your chosen algorithms, you should provide an explanation of the method via a visual. This visual can be a block diagram, a slide, or anything of your choosing. It should represent the method in a way that your fellow students would be able to understand the algorithm visually.

Rubric

- Notebook is well documented and includes details and references to the dataset and models used
- Three models are chosen from imodels and implemented using the imodels library
- Code implementation is correct
- Code implementation is clear and well documented
- Visual is high resolution and can be viewed
- Visual clearly explains the algorithm being explained
- Visual is intentional and creative
