Extra Credit: Removing Redundant Detections

As noted in the final extra credit question from the previous quiz, there are some knots in the test images that received multiple detections, like this one:

Use the last Extra Credit section of the live script to modify your detection results. See if you can get rid of the overlapping, redundant detections. Hint: use the `selectStrongestBbox` function. You can find [the documentation page here](#).

If done correctly, you should achieve a perfect detection miss rate of 0 and precision of 1.

If you'd like, share your results on the forums! We'll be there to cheer you on.
