Module Assessment

You used pre-trained deep-learning models and image segmentation in this module to detect objects. Now, it's time to apply these skills. The assessment is broken into two parts:

1. A quiz where you'll apply the YOLO pre-trained network to an image of cars on a busy street. The image you'll work with is a single frame from a video used for the final project.
2. A coding assignment where you need to segment curling stones from the background.

Part 1

Start by taking the quiz. You'll apply the tiny and large base-network YOLO models to a single frame from a video of vehicles on a busy street and investigate the accuracy of the detections. The provided "detectObjectsWithDeepLearning.mlx" reading will be helpful for the quiz.

Bonus: Try applying the tiny YOLO detector to the video "MathWorksRt9.mp4" included in the course files. How does the detector do? What if you lower the detection "Threshold" value? It will take 1-3 minutes to detect every frame using the tiny YOLO detector. If you use the full YOLO detector, it may take an hour without a GPU.

Part 2

In Part 2 you'll identify curling stones (curling is a winter Olympic sport) by segmenting them from the background. We encourage you to work in MATLAB, using apps like the Image Segmenter app, or writing code to do the segmentation. Once you're satisfied with your segmentation, copy your code into the online grader for assessment.

If you need help, post your questions on the forums. If you find yourself stuck on Part 2, be sure to review the material in our [Image Processing for Engineering and Science](#) specialization. You'll need these concepts for the next module.
