To Pass 80% or higher

🎉 Congratulations! You passed!

Grade received 100% To pass 80% or higher

Go to next item

1. An anomaly detector can be used to:

1 / 1 point

- ☒ Identify images that are likely to contain anomalies
- ☐ Classify images into multiple anomaly categories
- ☐ Identify the exact nature of anomalies in an image
- ☒ Correct

2. What does the model's anomaly score for each pixel represent?

1 / 1 point

- ☐ the variance between pixel intensities at that pixel location
- ☒ how anomalous the model considers that pixel
- ☐ the greyscale intensity of each pixel
- ☒ Correct
- The model then uses these pixel level anomaly scores to produce an overall anomaly score for the entire image.

3. How are images determined as normal or anomalous?

1 / 1 point

- ☐ By re-training the model on a calibration set
- ☒ By comparing their anomaly scores to a threshold value
- ☐ Images with overall anomaly scores in the top 10% are anomalous
- ☒ Correct

4. Which of the following is true about the anomaly threshold value? Select all that apply.

1 / 1 point

- ☒ You can visualize the distribution of anomaly scores in a histogram and set the value manually.
- ☒ Correct
- Yes, you can set the anomaly threshold value manually, which could help to optimize for precision or recall instead of accuracy.
- ☒ It can be determined automatically with the "anomalyThreshold" function in MATLAB
- ☒ Correct
- This function in MATLAB uses statistical methods to calculate an appropriate threshold value.
- ☐ It has a default value of 0.5

5. True or false: A PatchCore detector is typically more computationally efficient to train and use than an FCDD model.

1 / 1 point

- ☐ True
- ☒ False
- ☒ Correct
