Parking Labeling Project

Step 1: Create an Automation Function

Create an automation function for the parking images that loads detector from parkingYoloXDetectorSolution.mat, attached in the previous reading.

As a starting point, open up parkingImageLabeler.m in the course files and build your function using that file. Remember that you can refer to fastenersImageLabeler.m for an example if you get stuck.

Step 2: Automatically Label New Images

Once you have your automation function, use it to automatically label the new parking images.

Follow the workflow shown in [Model-Assisted Labeling](#) [↗](#) to apply your automation function on the new images. The main steps are:

- Open the Image Labeler app and create a new individual project.
- Add the appropriate labels: "EV", "Charger", and "Accessible".
- Import the new parking images, located in Data -> MathWorks Created -> Parking Spaces -> Additional Parking Images.
- Select all the images.
- Under "Algorithm", select "Custom Automation Function" and then "Automate".
- Click "Settings" and choose your automation function.
- Click "Run" to see your results.

Note: Remember to add the automation function to your MATLAB path before performing the automation! Otherwise, the function will not run.

If you wrote your automation function correctly, it will take a few minutes to apply the function to all the images. If you encounter an error instead, you need to go back and update your automation function. You can always compare your code to the fasteners example if you need a hint to find the issue.

Step 3: Adjust the Labels and Export Your Results

Finally, click through each image, adjusting the image labels as you see fit, and export your results to the workspace. You are ready to take the quiz! **Leave your app open as you work through the quiz in case you need to go back and adjust your labels again.**
