1. What is the Intersection over Union (IoU) used for in object detection models?

1 / 1 point

Try again

- ☐ To determine the number of objects in an image
- ☒ To evaluate the accuracy of the detected object's location and size
- ☐ To evaluate the model's accuracy in classifying objects

✔ Correct

The IoU threshold is used to evaluate size and location accuracy. You can change the threshold based on your application.

2. What is the area under the precision-recall curve called?

1 / 1 point

- ☐ Confidence Area
- ☐ Mean Average Precision (mAP)
- ☒ Average Precision (AP)

✔ Correct

The AP is a good metric to evaluate the performance of individual classes.

3. How do you calculate the mean average precision (mAP)?

1 / 1 point

- ☐ By averaging the precision values across all detections
- ☒ By taking the mean of the average precisions across all classes
- ☐ By averaging the IoU values across all classes

✔ Correct

The mAP is a useful metric for evaluating a detector since it averages the the AP across all classes.
