

Introducing the Week 2 Project

You've seen how to perform transfer learning on a dataset of fasteners. For the Week 2 project, you will perform transfer learning to classify the traffic signs dataset introduced in Week 1.

For this project, you will need to:

1. Prepare the traffic signs dataset
2. Set your training options
3. Update a pre-trained network for transfer learning
4. Train your network
5. Evaluate your results

Specifically, we require that you:

- Use **ResNet-18** as the pre-trained network you update
- Train for **6 epochs**

While we do not always recommend shortened training, it will make training more practical for this assignment (about 10 minutes on my CPU).

Once you are satisfied with your trained and evaluated model, proceed to the following quiz to answer questions about your method and results.
