1. Which of the following indicates the model's confidence in a given prediction?

1 / 1 point

- ☐ The test accuracy
- ☐ The number of layers in the network
- ☒ The predicted class score

Correct

In classification networks, the predicted class scores represent the probabilities of each class, and the highest score signifies the class the model is most confident the input belongs to.

2. How does occlusion sensitivity mapping help you interpret network behavior?

1 / 1 point

- ☐ It displays the outputs of any given network layer.
- ☐ It visualizes the distribution of predicted class scores.
- ☒ It shows how different regions of the image contribute to a given class

Correct

Occlusion mapping helps show which areas of an image contributed to a given class prediction by systematically covering parts of an image and observing how that changes the model's predicted class scores.

3. What does a positive value in an occlusion map indicate?

1 / 1 point

- ☒ Supporting evidence for the specified class
- ☐ Evidence for a different class
- ☐ Limited influence on the specified class

Correct

The higher the positive value, the more that region supports the specified class.

4. You can only make occlusion sensitivity maps for the class with the highest predicted class score.

1 / 1 point

- ☐ True
- ☒ False

Correct

You can create an occlusion sensitivity map for any class your model was trained on.

5. Occlusion sensitivity maps are only useful for investigating misclassified images.

0 / 1 point

- ☒ True
- ☐ False

Incorrect

Understanding how your network makes decisions is useful whether or not its predictions are correct.
