This quiz asks you questions about a trained model included in the course files, `trafficSignsWeek3Classifier.mat`.

To use this network, `load('trafficSignsWeek3Classifier.mat')`

For Questions 1 and 2, create an occlusion sensitivity map using the network specified above and `sign011721.png`.

`sign011721.png` is an image of a traffic sign included in the course files.

Your grade

We keep your highest score

1.

Use net, the network loaded above, make a prediction for the specified image.

1 / 1 point

Was the image correctly classified or misclassified?

- ☒ Correctly Classified
- ☐ Misclassified
- ☒ Correct

2.

Consider your generated occlusion map.

1 / 1 point

Which area of the image contributed most to the predicted class label?

- ☐ Quadrant A
- ☐ Quadrant B
- ☒ Quadrant C
- ☐ Quadrant D

Questions 3 and 4 ask you to examine the predicted class scores for an image (`sign12396.png`, included in the course files) using the network specified above.

3.

Using the simple traffic signs network, find the predicted class and predicted class scores for `sign12396.png`.

1 / 1 point

Was this model's prediction correct?

- ☐ The prediction was correct.
- ☒ The prediction was incorrect.
- ☒ Correct
- `[pred, score] = classify(net, img)`

4.

What was the predicted class score associated with this class prediction?

1 / 1 point

Enter your answer as a decimal between 0 and 1.

0.9481

- ☒ Correct
- `[pred, score] = classify(net, img) ;`
- `max(score)`

Questions 5- ask you to observe the following training plot and answer questions about how you might improve training based on what you see:

5.

What change to the **initial learning rate** would most likely improve the model represented by the above training plot?

1 / 1 point

- ☒ Decreasing it
- ☐ Changing the initial learning rate is unlikely to affect training
- ☐ Increasing it
- ☒ Correct
- The training plot looks irregular and jagged, which indicates you may want to lower the initial learning rate.

6.

What change to the **mini-batch size** would most likely improve the model represented by the above training plot?

1 / 1 point

- ☐ Decreasing it
- ☐ Changing the mini-batch size is unlikely to affect training
- ☒ Increasing it
- ☒ Correct
- Increasing the mini-batch size will reduce iteration-to-iteration variation, resulting in a less jagged training plot. Because this training plot is too irregular, this is a good strategy.

7.

What change to the **max epochs** would most likely improve the model represented by the above training plot?

1 / 1 point

- ☐ Decreasing it
- ☒ Changing the max epochs is unlikely to affect training
- ☐ Increasing it
- ☒ Correct
- Neither the validation accuracy nor validation loss is improving, so training for longer is unlikely to be effective.
