This assessment asks you about the model that you trained. If you trained multiple models, please answer the questions for your model with the highest test accuracy.

If you have not trained a model with a test accuracy of at least 90%, please return to the assignment and attempt to improve your trained model.

Generally, the validation and test accuracy of trained models will be similar. However, because this dataset has unusually small validation and test sets, the validation and test accuracy may differ. Even if your validation accuracy has yet to reach 90%, check your test accuracy to see if it has achieved at least 90%.

Take advantage of the "Addressing Common Issues" video and the course discussion boards for guidance.

1.

What was the absolute difference (as a percentage) between your model's **validation accuracy** at its final training iteration and your model's **training (mini-batch) accuracy** at its final training iteration?

1 / 1 point

Enter your answer as a number between 0 and 100. Do not include a % sign. For example, if your training accuracy was 95% and your validation accuracy was 70%, you would enter "25".

3.33

Correct

2.

Which letter was most likely to be misclassified by your model?

1 / 1 point

If multiple letters were equally likely to be misclassified, enter the most-misclassified letters separated by a comma.

M,P

Correct
confusionchart(LmdsTest.Labels, testPredictions)

3.

The course files include a function to grade your final, trained model. Pass your trained model as input to the function to see if it meets the project requirements.

1 / 1 point

testASLmodel(yourTrainedNet)

If your model passes this assessment, the function will return a numeric answer code. Enter that code here:

23061912

Correct
Congratulations!
