Almost there! Let's review your answers and then try again.

Your work showed skill in understanding hooks in CNNs, cloud function testing, and REST API development with Flask. However, there is room for growth in model deployment. Before retrying this assignment, we recommend focusing on this key area:

- **Model Deployment (101):** In Question 4, your understanding of the essential steps for setting up a model instance and creating a REST endpoint for predicting iris flowers was incomplete. Try reviewing [this item](#) to refresh your memory.

Good job.

Retry assignment

1. What is a primary use of forward hooks in a Convolutional Neural Network (CNN)?

1 / 1 point

- ☐ To modify gradient values during backpropagation
- ☐ To completely halt the training process
- ☒ To inspect intermediate activations after certain layers
- ☐ To directly update weights of specific layers

✔ Correct
Correct! Forward hooks allow you to inspect intermediate activations and gain insights into the internal workings of the network.

2. When using backward hooks, what kind of information can they provide in a CNN?

1 / 1 point

- ☐ The learning rate used at each step
- ☐ The number of epochs completed
- ☐ The total number of layers in the network
- ☒ Gradients of activations with respect to the loss

✔ Correct
Correct! Backward hooks provide insights into gradients, crucial for understanding backpropagation.

3. Which tool can be used to test and monitor a deployed cloud function for user input predictions?

1 / 1 point

- ☐ SQLite
- ☐ Jupyter Notebook
- ☒ Postman
- ☐ TensorBoard

✔ Correct
Correct! Postman is commonly used to test and monitor APIs.

4. Which of the following steps are essential when setting up a model instance and creating a REST endpoint for predicting iris flowers?

0.8 / 1 point

☑ Loading pre-trained model weights

✔ Correct
Correct! Loading pre-trained model weights is an essential step.

☑ Defining the model architecture from scratch

✘ This should not be selected
Incorrect. You generally load a pre-trained model rather than defining the architecture from scratch.

☑ Creating endpoint routes for prediction

✔ Correct
Correct! Creating endpoint routes for prediction is necessary for the REST API.

☐ Creating a dataset from raw data

☑ Setting up the Flask application

✔ Correct
Correct! Setting up the Flask application is crucial for creating the REST endpoint.

5. What is the primary purpose of using Flask in developing a REST API?

1 / 1 point

- ☒ To handle HTTP requests and define endpoints for the API
- ☐ To train machine learning models
- ☐ To store data in a relational database
- ☐ To perform data visualization

✔ Correct
Correct! Flask is used to handle HTTP requests and define endpoints for the API.
