Why Use Decision Trees for Autonomous Agents?

DECISION TREES

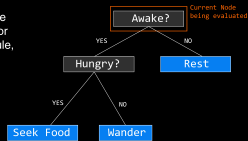

DECISION TREES

In order to construct a decision tree within any of our agents, we will have to create a Node Class:

Based on a generic decision tree, we can start modeling some behavior. Let's see what could be a simple representation of behavior for our herbivore class.

DECISION TREES

Navigating the Decision Tree

This structure allows for modeling complex agent behaviors with simple, hierarchical decision-making processes. The tree can be expanded or modified to include more decisions and actions, allowing for a wide range of behaviors in the simulated ecosystem.
