7.R.R1 (1/1 point)

Load the data from the file [7.R.RData \(/c4x/HumanitiesScience/StatLearning/asset/7.R.RData\)](/c4x/HumanitiesScience/StatLearning/asset/7.R.RData), and plot it using `plot(x,y)`. What is the slope coefficient in a linear regression of `y` on `x` (to within 10%)?

Answer: -0.6748**EXPLANATION**

The slope is negative for most of the data, and the coefficient reflects that.

7.R.R2 (1/1 point)

For the model $y \sim 1 + x + x^2$, what is the coefficient of `x` (to within 10%)?

Answer: 77.7**EXPLANATION**

Despite the fact that the overall slope is slightly negative, the linear term is very positive. Because the values of `x` are far from zero, a large linear term is needed to offset the quadratic term; otherwise the slope would be very negative in the range of the data. This is why we usually do not interpret the lower-order terms in a polynomial regression.
