1. 1 / 1 point

What does Vertex AI offer to achieve your ML goals?

- ☒ Fast experimentation, accelerated deployment, and simplified model management
- ☐ Slow experimentation, accelerated deployment, and simplified model management
- ☐ Slow experimentation, accelerated training, and simplified model management
- ☐ Fast experimentation, decelerated deployment, and simplified model management

Correct
This answer is correct.

2. 1 / 1 point

What method do you use to create and train a model with minimal technical effort to quickly prototype models and explore new datasets before investing in development?

- ☐ Managed dataset
- ☒ AutoML
- ☐ Unmanaged dataset
- ☐ Endpoints

Correct
This answer is correct. AutoML lets you create and train a model with minimal technical effort. Even if you want the flexibility of a custom training application, you can use AutoML to quickly prototype models and explore new datasets before investing in development.

3. 1 / 1 point

What prediction method do you use for synchronous or real-time prediction that quickly returns a prediction but only accepts one prediction request per API call?

- ☒ Online prediction
- ☐ Batch prediction
- ☐ Online and batch prediction
- ☐ AutoML prediction

Correct
This answer is correct. Vertex AI online prediction is optimized to run your data through hosted models with as little latency as possible.

4. 1 / 1 point

Which AutoML model type analyzes your video data and returns a list of shots and segments where objects are detected?

- ☐ Image classification model
- ☐ Video classification model
- ☐ Video action recognition model
- ☒ Video object tracking model

Correct
This answer is correct. A video object tracking model analyzes video data and returns a list of shots and segments where certain objects were detected. For example, if it analyzes video data from a soccer game, it can identify and track the ball.

5. 1 / 1 point

What is true about batch prediction?

- ☐ Batch prediction is optimized to minimize the latency of serving predictions.
- ☐ Batch prediction is a synchronous, or real-time, prediction, which means that it quickly returns a prediction.
- ☒ Batch prediction is useful for making several prediction requests at the same time and is optimized to handle a high volume of instances in a job.
- ☐ Predictions returned in the response message.

Correct
This answer is correct. Requesting a batch prediction is an asynchronous request, which means that the model waits until it processes all of the prediction requests before returning a response in JSON files in Cloud Storage buckets.
