1. What is the primary advantage of stereo vision in predators like eagles and hawks?

1 / 1 point

- ☒ Enhanced depth perception for hunting
- ☐ Ability to see in low-light conditions
- ☐ Increased field of view
- ☐ Better camouflage

✔ Correct

The primary advantage of stereo vision in predators like eagles and hawks is enhanced depth perception for hunting. Having forward-facing eyes allows these predators to overlap their fields of vision, which means that each eye sees a slightly different image of the same object. The brain processes these differences and uses them to calculate the distance and depth of objects with greater accuracy.

2. What is the term for the phenomenon where the brain combines the images from both eyes to create a single, unified perception of the world?

1 / 1 point

- ☒ Stereopsis
- ☐ Holography
- ☐ Monovision
- ☐ Hypnosis

✔ Correct

Stereopsis is the ability of the brain to merge the slightly different images received from each eye into a single three-dimensional perception of the world. It is what allows us to perceive depth and see objects in three dimensions, making it an essential component of our stereo vision.
