

What it mean when a problem has a status of -1 after solving in Python's pulp library?

Asked 3 years, 7 months ago Modified 3 years, 7 months ago Viewed 2k times

I've been getting a status code of -1 after solving my linear programming problem.

```
1 status = problem.solve()
   # status == -1
```

Based on my research, -1 isn't a status code that should even be possible. There are no errors while adding constraints/variables to the problem. I know that the problem is solvable because I have already solved it elsewhere (the code was garbage so I'm rewriting it). I've tried reinstalling pulp, which didn't work, and I don't know how to begin troubleshooting this. Why am I getting this status?

You can have more detailed information by checking the corresponding status associated with the value. In your case:

```
5 >>> pulp.LpStatus[-1]
   'Infeasible'
```

In general, the possibilities are:

```
>>> pulp.LpStatus
{'0': 'Not Solved', 1: 'Optimal', -1: 'Infeasible', -2: 'Unbounded', -3: 'Undefined'}
```

 **abc**
11.7k 2 26 52

 Thanks! Knowing it was Infeasible helped me find out where I was going wrong when adding constraints. – **Henry Westfall** Jul 10, 2020 at 1:21
