

Module 'tensorflow' has no attribute '.\_\_version\_\_'. Tensorflow v 2.11.0. Why?

print(tf.\_\_version\_\_) doesn't work. Same thing with print(tf.version), print(tf.version.VERSION), print(tf.VERSION)

I am using Windows 10 x64. Python v 3.10.7.

I don't want to reinstall to the old version of Tensorflow 1.14

pip list:

```
tensorflow 2.10.1
tensorflow-data-server 0.5.1
tensorflow-plugin-wit 1.8.1
tensorflowX 2.5.1
tensorflow 2.11.0
tensorflow-addons 0.19.0
tensorflow-estimator 2.10.0
tensorflow-gpu 2.10.1
tensorflow-intel 2.11.0
tensorflow-io-gcs-filesystem 0.28.0
termcolor 1.1.0
```

If I write simply print(tf), then it gives out this:

```
import tensorflow as tf
print(tf)

0.5s

<module 'tensorflow' (<_frozen_importlib_external._NamespaceLoader object at 0x000001450887880>)>
```

Show us this output print(tf.\_\_file\_\_) – John Gordon Dec 11, 2022 at 21:01

It prints: None. What does it mean? – solidsnake777 Dec 11, 2022 at 21:24

Well, that's unusual. I hoped it would print out the full path to the tensorflow module, which in turn might tell us if you were accidentally importing the wrong thing. Try this instead: print(dir(tf)) – John Gordon Dec 11, 2022 at 22:29

@JohnGordon I've been having the same problem. Output is: ['doc', 'file', 'loader', 'name', 'package', 'path', 'spec'] – SnakeWasTheNameTheyGaveMe Jan 31, 2023 at 3:27

I am having the same problem with tensorflow 2.12.0 I just upgraded to so that I can load audio dataset from a directory. I get ['doc', 'file', 'loader', 'name', 'package', 'path', 'spec'] Any resolution for this issue? – Sameer Mahajan Apr 23, 2023 at 11:39

I create a new virtual environment using anaconda, and reinstalled tensorflow with pip install tensorflow==2.11.0. Everything is ok afterwards.

I have tried @JohnGordon's testing methods, all outputs were fine.

If you downgrade to TensorFlow==2.10 it should fix the issue. \_\_version\_\_ attribute was removed from 2.11

I think there are random issues with tensorflow like this at times when installed in a physical environment which seem to go away after moving to a virtual environment.

Could you please try again as I replicated the same above code in mentioned version of Python 3.10 and TensorFlow 2.11 in conda environment, which shows the expected result as mentioned below:

In [1]: import tensorflow as tf

In [2]: tf.\_\_version\_\_

Out[2]: '2.11.0'

In [3]: !python --version

Python 3.10.9

In [4]: tf.version.VERSION

Out[4]: '2.11.0'

In [5]: !pip list

```
tensorflow 2.11.2
tensorflow-data-server 0.6.1
tensorflow-plugin-wit 1.8.1
tensorflow 2.11.0
tensorflow-estimator 2.11.0
tensorflow-intel 2.11.0
tensorflow-io-gcs-filesystem 0.30.0
termcolor 2.2.0
terminado 0.17.1
tinycss2 1.2.1
tokenizers 0.13.2
tornado 6.2
tqdm 4.64.1
traitlets 5.7.1
```

same result as before I'm afraid, following your nice script. I'll try again after 2.10 to 2.11 – Nick Feb 17, 2023 at 10:56

when I do that it also fails python38 tensorflow 2.10 it did work on tensorflow 3.8.3 before I upgraded to 2.10 I have followed the interesting script above again and they all fail

AttributeError: module 'tensorflow' has no attribute 'version'

AttributeError: module 'tensorflow' has no attribute 'version'

For me print(tf.\_\_version\_\_) works fine so try reinstalling tensorflow
