Your latest: 100% • Your highest: 100% • To pass you need at least 50%. We keep your highest score.

1.

What is the purpose of using 'unconditional guidance scale' in text-to-image generation models?

1 / 1 point

☐

To dictate file format of images

☐

To control the color gradient

☒

To adjust how closely the image matches the prompt

☐

To modify the resolution

✔

Correct

Correct! Unconditional guidance scale affects the image's adherence to the prompt.
2.

In physics, what drives the diffusion process described in AI models?

1 / 1 point

☐

Nuclear interaction

☐

Gravitational forces

☐

Electric fields

☒

Concentration gradient

✔

Correct

Correct! The movement from high to low concentration areas is driven by a concentration gradient.
3.

What role does 'batch size' play in generating images from text prompts in AI models?

1 / 1 point

☐

It alters the complexity of the model

☐

It impacts memory usage drastically

☒

It determines the number of images generated at once

☐

It affects the quality of each individual image

✔

Correct

Correct! Batch size limits how many images are produced per prompt.
4.

How can noise prediction be applied in training AI models using self-supervised learning?

1 / 1 point

☐

By simulating manual data labelling

☒

By predicting and reducing randomness in inputs

☐

By increasing learning complexity

☐

By replicating human annotations

✔

Correct

Correct! Predicting noise involves reducing randomness to understand patterns better.
5.

What is the function of the 'pop' operation in the context of a neural network stack?

1 / 1 point

☐

To duplicate the top element of the stack

☐

To reverse the order of elements in the stack

☒

To remove an element from the top of the stack

☐

To add an element to the top of the stack

✔

Correct

Correct! 'Pop' removes the element from the top of the stack.
