1. Why is it essential to split your dataset into training and validation sets?

1 / 1 point

- ☐ They enhance model loading speed
- ☒ They help to tune model parameters for better performance
- ☐ They are used to auto-save model weights
- ☐ They allow testing the model output on the training data

✔ **Correct**
Correct! Validation sets are used to optimize hyperparameters for better model generalization.

2. In TensorFlow, what is a common first step after setting up the model for training?

1 / 1 point

- ☐ Visualizing the dataset samples.
- ☒ Compiling the model with loss and optimizer.
- ☐ Conducting a preliminary test run.
- ☐ Deploying the model to production.

✔ **Correct**
Correct! Compilation defines key components for model training, like loss functions and optimizers.

3. What is the purpose of using 'unconditional guidance scale' in text-to-image generation models?

1 / 1 point

- ☐ To dictate file format of images
- ☐ To control the color gradient
- ☐ To modify the resolution
- ☒ To adjust how closely the image matches the prompt

✔ **Correct**
Correct! Unconditional guidance scale affects the image's adherence to the prompt.

4. Why is Scikit-learn an important library to have installed on Anaconda?

1 / 1 point

- ☐ It's a database management system.
- ☐ It's used for 3D rendering.
- ☒ It contains prebuilt machine learning models.
- ☐ It is essential for operating GPU computations.

✔ **Correct**
Correct! Scikit-learn is known for its comprehensive suite of ML models.

5. What is the main advantage of learning algorithms applicable to all datasets?

1 / 1 point

- ☐ They use less memory
- ☒ They are adaptable to multiple industries
- ☐ They are faster
- ☐ They look modern

✔ **Correct**
Correct! They can be applied to a variety of datasets across different industries.
