

exercise3.py

```
1 from sklearn.feature_extraction.text import CountVectorizer
2 from sklearn.metrics import jaccard_score
3
4 # Collect user input
5 documents = []
6 documents.append(input("Enter first document contents: ").strip())
7 documents.append(input("Enter second document contents: ").strip())
8 print("The Jaccard similarity coefficient score between these documents is: ")
9
10 # WRITE YOUR CODE HERE
11 vectorizer = CountVectorizer(stop_words='english', binary=True)
12 X = vectorizer.fit_transform(documents)
13 print(jaccard_score(X.toarray()[0], X.toarray()[1]))
```

100% (13:53)

Terminal

```
codio@horizonliquid-elasticsusan:~/workspace$ python3 exercise3.py
Enter first document contents: This is the first document.
Enter second document contents: This document is the second document.
The Jaccard similarity coefficient score between these documents is:
0.5
codio@horizonliquid-elasticsusan:~/workspace$
```

Coding Exercise 3

In the top-left pane, write code that will calculate and print the Jaccard score of the two `documents` which will be captured by keyboard input.

Make sure to:

- Use `CountVectorizer`
- Filter out punctuation
- Filter out stop words
- Ignore case
- Score by existence (i.e. `binary` scoring)

Output the Jaccard score.

Test your code using the terminal in the bottom-left:

TRY IT

Example Input/Output:

This is the first document.
This document is the second document.

The Jaccard similarity coefficient score between these documents is:
0.5

Submit your code for feedback by pressing the button below.

The first step is to properly vectorize the documents:

```
vectorizer = CountVectorizer(stop_words='english', binary=True)
X = vectorizer.fit_transform(documents)
```

The second step is to calculate the score between the documents and print it out:

```
print(jaccard_score(X.toarray()[0], X.toarray()[1]))
```

Check It!

LAST RUN on 12/27/2023,
4:46:06 AM

Check 1 **passed**
Check 2 **passed**
Check 3 **passed**
